Fleet Management

As a fleet manager, ensuring the safety of your drivers and vehicles is a top priority. With Consat's Fleet Management Solutions, you can easily monitor the state of your vehicles, reduce downtime and save money.

Streamlined pre and post-shift procedures for drivers

Remote access to tachograph data, saving time and reducing expenses

Real-time fault management to quickly resolve any issues in vehicles

Centralised AC control, saving energy and reducing unnecessary work

Comprehensive tools for managing fleet and transportation systems on any device, anywhere

Driver Checklists and Reports – Ensure Compliance and Improve Safety

Our checklists and driver reports improve vehicle maintenance by enabling drivers to complete pre- and post-shift checklists and report any issues they encounter. The checklists are tagged with the driver ID for accountability and are immediately available to relevant personnel. The reports can include photos or free text, allowing you to address issues before they become major problems and reduce vehicle downtime.

Tachograph Integration – Maximise Safety and Performance

With Consat's Tachograph Integration, you can remotely access your tacho data, reducing the need to access data locally in every vehicle. Our solution uses secure and encrypted connections to access the data in your tachographs from your office, and you can schedule periodical downloads. Our administration tools, available through our Configuration Manager system, provide fault management and real-time status.

Vehicle Fault Management – Minimise Downtime and Maintenance Costs

Our Fault Management Overview tool allows you to monitor and manage vehicles and sign faults in real time. You can assess the current "health" of your Consat systems and prioritise your work based on basic stats showing the distribution of fault codes and their severity. You can troubleshoot a specific vehicle/sign system by accessing the corresponding Fault History view and requesting diagnostic files for in-depth troubleshooting.

Smart Temperature Control – Efficient Climate Control

Our Smart Temperature solution is controlled by the vehicle assignment, which means each vehicle wakes up at a set time to check if it has an assignment for the day. If so, it schedules a wake-up to start the heater or air-conditioning, depending on the climate, well in time before the first journey. Each heater and AC starts just in time according to a pre-set and vehicle type-specific scheme, and they're turned off when set temperatures are reached. The temperature status is monitored by our Fault Management system.

Electric Vehicle Support – Carefree Integration of Electric Vehicles Into Your Fleet

Fleet Studio offers additional functionality for electric vehicles, including monitoring chargers and charging, analysing energy consumption, and planning overnight or opportunity charging. The application includes a Charging Point view, an Energy Report, and real-time battery monitoring to provide the most important functionality for electric public transport.
